COS30043 Interface Design and Development

Lab 03. Vue Directives

Overview

The purpose of this lab is to develop a responsive web application using Vue.js 3 and Bootstrap that allows users to search for events and provides a registration form.

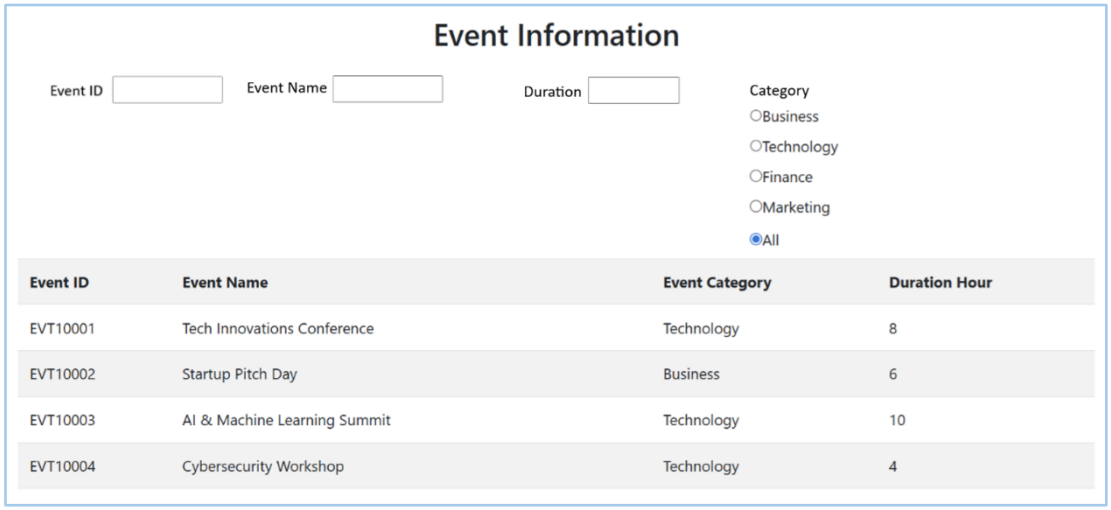
1. Event Information (Searchable Table)

The event data are stored in the events.txt file. Initially, display all events from events.txt in a table. The table must include four columns:

- Event ID
- Event Name
- Category
- Duration (Hours)

Create separate text input fields for searching by Event ID, Event Name, and Duration. Use radio buttons for filtering by category (Technology, Business, Marketing, Finance, All).

The picture below is for illustration purposes only to help you understand the requirements. You are free to use your own design and layout.



… …

2. Registration Form

Implement a registration form that includes:

- A username input field
- A password input field
- A confirmation password input field (a message should appear beside the input box if the passwords do not match)
- Radio buttons to select an event category
- A drop-down list for event names, populated dynamically based on the selected category

Once the user makes a selection, display a summary message showing:

- Username
- Selected category
- Selected event name
